Patient Name : **MR. PAWAN DUBEY**

Age : 28 years (Male)

Referral : SELF

Reg. ID : OP - 16491

Report Date : Jan 23, 2024, 07:28 p.m.

Report ID : 61353

COMPLETE BLOOD COUNT

Test Description	Value(s)	Reference Range
Hemoglobin	15.5 g/dl	13 - 17
Packed Cell Volume	45.3 %	39 - 51
R.B.C. Count	5.19 mil/cu.mm	4.5 - 6.5
Total Leucocyte Count	6800 /cu.mm	4000 - 11000
Platelet Count	211000 /cu.mm	150000 - 450000

RED CELL INDICES

Mean Cell Volume(MCV)	87.28 fl	76 - 96
Mean Cell Hemoglobin(MCH)	29.87 pg	27 - 32
Mean Cell Hb Conc(MCHC)	34.22 g/dl	32 - 36
RDW (CV)	13.2 %	12.0 - 14.5

DIFFERENTIAL COUNT

Neutrophils	68 %	40 - 75
Lymphocytes	28 %	20 - 45
Eosinophils	02 %	1 - 6
Monocytes	02 %	2 - 8
Basophils	0 %	0 - 1

PERIPHERAL SMEAR EXAMINATION

RBC Morphology	Normocytic Normochromic
WBC Morphology	Within normal limits
Platelets	Adequate

GLYCOSYLATED HAEMOGLOBIN (HBA1c)

Test Description	Value(s)	Reference Range
Result	4.3 %	NONDIABETIC : 2.5-6.3 DIABETIC PATIENT Good control : 5.5-6.7 Fair control : 6.8-7.6 Poor control : >7.6
Estimated Average Glucose :	88 mg/dL	70 - 140
Method	High Performance Liquid Chromatography (HPLC)	

Note

Hemoglobin is the substance inside red blood cells that carries oxygen to the cells of the body.

Glucose (a type of sugar) molecules in the blood normally become stuck to hemoglobin molecules, this means the hemoglobin has become glycosylated (also referred to as hemoglobin A1c, or HbA1c).

As a person's blood sugar becomes higher, more of the person's hemoglobin becomes glycosylated. The glucose remains attached to the hemoglobin for the life of the red blood cell, or about 2 to 3 months.

A blood test can measure the amount of glycosylated hemoglobin in the blood. The glycosylated hemoglobin test shows what a person's average blood glucose level was for the 2 to 3 months before the test.

This can help determine how well a person's diabetes is being controlled over time

VITAMIN B12

Test Description

Value(s)

Reference Range

Result

115.3 pg/ml

200 - 835

Method

ELISA

INTERPRETATION

Vitamin B12 or cyanocobalamin, is a complex corrinoid compound found exclusively from animal dietary sources such as meat, eggs and milk. It is critical in normal DNA synthesis, which in turn affects erythrocyte maturation and in the formation of myelin sheath. Vitamin B12 is used to find out neurological abnormalities and impaired DNA synthesis associated with macrocytic anemias. For diagnostic purpose, result should be always assessed in conjunction with the patients medical history, clinical examination and other findings.

VITAMIN D3 (25- HYDROXYCHOLECALCIFEROL)

Test Description	Value(s)	Reference Range
Result	12.15 ng/ml	Deficient : 0 - 5 Insufficient : 6 - 20 Hypovitaminosis D : 21 - 40 Sufficient : 41 - 100 Toxicity : >100
Method	ELISA	

INTERPRETATION

Two biologically relevant forms of Vit. D are D2(ergocalciferol) and D3(cholecalciferol).

- Vit. D2 is obtained from diet and supplements.
- Vit. D3 is synthesized through exposure to sunlight.

Both these forms are metabolized in the liver and kidney to form 25 (OH) & 1,25 (OH)₂ which are the active forms. Causes of Vit. D deficiency are very low dietary intake, malabsorption, liver disease, drugs (phenytoin, phenobarbitone), less exposure to sunlight and age related. A high global prevalence of Vit D insufficiency / deficiency is seen presently & is related to impaired bone metabolism (rickets/ osteoporosis), secondary hyperparathyroidism, cancers, autoimmune disorders, cardiovascular problems.

Kindly correlate clinically. Repeat with fresh sample if indicated clinically.

THYROID FUNCTION TEST (TFT)

Test Description	Value(s)	Reference Range
Triiodothyronine (T3)	1.09 ng/ml	0.79 - 1.60
Thyroxine (T4)	5.09 µg/dl	4.9 - 11.0
Ultra TSH	1.75 µIU/ml	1-3 days : < 38.9 1-2 weeks : 0.60 - 10.0 2-20 weeks : 1.7 - 9.1 Children & Adult : 0.38 - 5.30
Method	Immunofluorescence (Fully automated TOSOH AIA 360)	
Note	TSH measurement is useful in screening and diagnosis for euthyroidism, hyperthyroidism and hypothyroidism. TSH levels may be affected by acute illness and drugs like dopamine and gluco corticoids. Low or undetectable TSH is suggestive of graves disease. TSH between 5.6 to 15.0 with normal T3 T4 indicates impaired thyroid hormone or subclinical hypothyroidism or normal T3 T4 with slightly low TSH suggests subclinical Hyperthyroidism. TSH suppression does not reflect severity of hyperthyroidism therefore, measurement of free thyroid is important. Free T3 is first hormone to increase in early Hyperthyroidism. Only TSH level can prove to be misleading in patients on treatment. Therefore Free T3, Free T4 along with TSH should be checked.
